PROFESSIONAL SUMMARY

Computer Engineer and Full Stack Developer with 2+ years working on production web applications, across backend with NestJS and Go (TypeORM, PostgreSQL, Redis) and frontend with Vue 3, React and TypeScript. My work has centred on REST API design and development, payment gateway and banking integrations, database modelling and migrations, and automated testing with Jest. Used to maintaining live products, resolving real production incidents and working alongside business teams so that every solution answers a concrete need. English B2.

TECHNICAL SKILLS

Backend: Go, Node.js, NestJS, TypeORM, PostgreSQL, MySQL, Redis, JWT/Passport, REST APIs, Swagger/OpenAPI, cron jobs, AWS S3

Frontend: Vue.js 3, React, TypeScript, JavaScript (ES6+), Vite, PrimeVue, Pinia, Tailwind CSS, Chart.js, MapLibre GL

Practices & tools: Jest (automated testing), Git, GitHub, Docker, Jira, payment and banking integrations, REST API design, Agile methodologies

Other: PHP, WordPress, Divi, Linux, macOS, Windows

PROFESSIONAL EXPERIENCE

Full Stack Web Developer — Grupo Banklot

July 2024 – August 2026 | Remote

Full stack development across an ecosystem of production transactional platforms (Lotomatic, GatoWeb, Loterías24, Lottolivery and Registry), with banking, payment gateway and third-party provider integrations.

- Contributed to the backend (NestJS, TypeORM, PostgreSQL, Redis) of a platform that grew its monthly volume **almost 100x in 5 months**, from around 3,000 to over 300,000 operations, supporting close to 5,000 registered users, more than 250,000 fund transactions and over 90,000 notifications processed from an external payment gateway, across more than 50 product variants integrated with a third-party provider.
- Built the purchase flows for the application ecosystem with a **Go backend**, used today by more than 5,000 active agencies and close to 15,000 users, handling over **20 million operations per month**.
- Delivered «Paguetodo» end-to-end, frontend and backend in Go: a utility payment module (TV, telephony and internet) that expanded the platform into a new business line.
- Designed and built the **referral programme end-to-end** — backend, admin panel and client interface — including a configuration module that lets the business team enable or disable the bonus and adjust minimum deposit and reward with no engineering involvement, reporting and tracking charts for the finance team, and concurrency control to prevent duplicate rewards on simultaneous deposits.
- Developed the backend (NestJS, PostgreSQL) and frontend (Vue 3) of the official operator registration platform for a public lottery body, digitising document verification (KYC) with AWS S3 storage, PDF report generation and point-of-sale geolocation.
- Implemented the payment notification webhook with a **national banking institution**, secured with API Key authentication, passing the bank's official certification process.
- Contributed to an API of **50+ controllers and close to 300 REST endpoints**, backed by nearly 50 database migrations and more than 40 automated test suites with Jest.
- Contributed to the operations admin panel used to track sales by agency and distributor and manage network commissions, adding validations that block configurations outside approved business limits.

Freelance Web Developer — Event equipment rental company

December 2023 – April 2024

- Designed and developed the corporate website as the sole technical profile on the project, covering everything from requirements gathering with company management to building the solution with WordPress and Divi.
- Built the product catalogue and the quote request flow, the foundation of the company's digital lead generation channel.
- Led direct communication with the client, translating commercial objectives into product decisions and managing scope and priorities independently.

Frontend Developer (Internship) — GENIO, Casa de Software

January 2023 – April 2023

- Developed and shipped to production the corporate website using HTML, CSS, JavaScript, PHP and SQL, which became the company's official digital presence.
- Designed and implemented a dynamic landing page in JavaScript that strengthened the commercial presentation of the product and visitor engagement.
- Built a private licence lookup module connected to the database, giving clients autonomy over their own information and removing recurring manual queries from the support team.

EDUCATION

Computer Engineering Degree (Ingeniería en Informática) — Universidad Dr. Rafael Belloso Chacín (URBE) | 2019 – 2023
